Porosity air loss reduced significantly

- ✓ **More even tire wear = longer tire life**
- ✓ **Retreadability improved**
- ✓ **Fuel mileage increased**

Porosity leaks in the tread area are plugged immediately following the product's installation, thereby reducing monthly air loss due to normal migration of air through the rubber. SIMONIZ sealtite® will significantly increase the life of your tires by nearly eliminating normal porosity air loss. An average truck tire loses 2-5 psi per month due to rubber porosity. In fact, studies show that use of SIMONIZ sealtite® in each tire will reduce normal air loss by up to 90%, extending the overall life span of an average tire by 10% to 30%. As a result, users of SIMONIZ sealtite® will experience even tread wear and greater fuel efficiency, allowing drivers to travel thousands of extra miles on every tire with lower fuel costs.

Goodyear tests have shown: 15% under-inflation results in about an 8% drop in expected tread mileage and a 2.5% decrease in miles per gallon.

How does it work?

SIMONIZ sealtite® create an impermeable skin on the inside of the tire tread which seals the majority of pores, eliminating 90% of porosity air loss.
